ABSTRACT

Monte Carlo procedures designated as LITE-I and LITE-II were developed to study the transport of light through the earth's atmosphere under various environmental conditions. LITE-I treats monochromatic light emitted from a point source, and LITE-II treats monochromatic plane sources of light. The codes have been written in both ALGOL for the Burrough's B-5000 and FORTRAN II for other computers. The codes are sufficiently flexible to treat multiple scattering in an atmosphere in which air density and aerosol size distribution vary independently and arbitrarily with altitude. Provision for treating ground and cloud reflection with an albedo method is also available in the codes.

The codes have been verified through comparisons with other calculations of light transport in the atmosphere. Utilization instructions, input data formats, sample problems, and the ALGOL listings of the codes are given to aid those who wish to utilize the codes.

FOREWORD

The authors wish to express their appreciation to Henrietta Hendrickson and Hemma Francis of Oak Ridge National Laboratory who aided in the checkout and running of test problems on the FORTRAN versions of the LITE codes. They also wish to acknowledge the assistance of Leon Leskowitz, of the U. S. Army Electronics Laboratory, Fort Monmouth, New Jersey, for his assistance in translating the FORTRAN codes to the ALGOL language and his many helpful suggestions during the checkout of the ALGOL versions of the LITE codes. The work described in this report was carried out under the technical monitorship of Dr. R. W. Fenn of the Atmospheric Sciences Laboratory, USAEC, Fort Monmouth, New Jersey.

I. INTRODUCTION

The LITE-I and LITE-II codes were developed to study the transport of light in a plane atmosphere under various environmental conditions. LITE-I treats multiple scattering from a point source of light, and LITE-II treats multiple scattering from a plane source of light. The Monte Carlo methods utilized in the codes are described in detail in Volume I of this report. The description includes the methods used to describe an air-ground geometry, to treat Rayleigh and Mie scattering, and to treat ground and cloud reflection.

The LITE codes were written in both ALGOL for the B-5000 and FORTRAN II for other computers. This volume of the report includes the input data formats for the ALGOL versions of the codes. The input data formats for the FORTRAN versions are different from those in ALGOL versions, only in that the format for floating point numbers have an E preceding the exponent, rather than an @ symbol. That is, the number 217.8 would be written in floating form as 2.178@+02 for the ALGOL versions of the code, and 2.178E+02 for the FORTRAN versions. The order of the input data and field width specifications are the same for both the FORTRAN and ALGOL versions.

This volume of the report should be considered as a utilization document for the LITE-I and LITE-II codes. Operator instructions for running the LITE codes on the B-5000 computer and on the IBM 7090 are contained in Section II. The input data formats for the ALGOL versions of the two codes are given in Section III. The input and output of a sample problem run with each code, LITE-I and LITE-II, are discussed in Section IV. In Section V, listings of the ALGOL language instructions for the two LITE codes are presented.

II. OPERATOR INSTRUCTIONS

The ALGOL versions of the LITE codes were designed to run on the Burroughs B-5000 computer. The multi-processing feature of the B-5000 allows on-line read in and printout of data from one program while computation is being performed with another program. Thus the LITE codes may be read-in and printed-out on-line. The Fort Monmouth computing center plans to store the object program on tape and read the program from tape to reduce the number of cards that have to be loaded each time a program is run with one of the codes. The ALGOL versions use no tape units other than those that a facility normally uses for input and output.

The FORTRAN versions of the LITE codes are designed for off-line read-in and printout. The FORTRAN II binary decks and the problem decks are loaded on input tape 5 and the output is produced on output tape 6. No scratch tapes are required for the program operation.

The running time for the LITE codes is highly dependent upon the input data. In particular, the running time is dependent on the fraction of the total collisions that are taken to be Rayleigh scattering events, on the average number of collisions followed per history, and on the total number of histories followed. The multi-processing feature of the B-5000 makes it difficult to predict the machine time required to run a given problem unless the problem is the only one being processed in the B-5000. The time required to run a LITE-I problem on the B-5000 was checked for three separate runs of the problem. The times required for each of the three runs were found to be different, varying by a factor of three over the range of the

slowest to the fastest time. The average time per collision is estimated to be about .002 minutes for problems having five detector positions.

III INPUT DATA FORMATS

The input data formats for LITE-I and LITE-II are identical even though some of the input data used in LITE-I are not used in LITE-II. The provisions for reading in these items are the same for both codes, therefore, those input data not actually used in the LITE-II calculations are indicated by an asterick, and comments are made in the following sections prescribing how these items should be treated when preparing input data for LITE-II. The unit used to define distances (centimeters, meters, feet, etc.) should be the same for all distances described by the input data to the LITE codes. If the unit is meters, then the intensities are in units of photons m^{-2} /source photon for LITE-I and photons m^{-2} /source photon m^{-2} for LITE-II.

The input for the LITE codes is divided into ten groups. The number in column 10 of the first card of each group designates the group of input data that follows on that and succeeding cards.

3.1 Control Numbers

Table I contains control numbers in Group I that specify the amount of input data required. Some of the control numbers appear again in the other input groups. When this occurs, the two values input for the same item must agree or the program will detect an error and terminate the problem. The number of histories to be processed, NHMAX, may be divided into sample sizes of NHMAX/NGROUP. The sample size must be less than 500. The number of groups, NGROUP, into which the histories are divided, should be large enough to provide for an accurate calculation of a standard deviation. Six bases are input for the random number generator. This allows consecutive random numbers to be generated

TABLE I

GROUP 1 Input Data (Control Numbers)

| Card | Format | Input Item | Definition | Limit |
|------|--------|------------|--|---------------------------------|
| 1 | I10 | LIBRAY | Input group number | =1 |
| 2 | 6I10 | NHMAX | Number of histories | |
| | | NGROUP | Number of deviation groups (The number of histories should be equally divisible by NGROUP.) | $\frac{NHMAX}{NGROUP} \leq 500$ |
| | | NRMAX | Number of regions | _100 |
| | | NBMAX | Number of boundaries | _100 |
| | | NCMAX | Maximum collisions allowed per history | |
| | | NDMAX | Number of receivers | _10 |
| 3 | 6I10 | NPA | Number of print cosines | _25 |
| | | NPCOL | Number of print collisions | _24 |
| | | NAOP | Option for sampling source angles = -1, isotropic distribution, no biasing = 0, biased sampling from isotropic distribution = 1, anisotropic distribution | |
| | | NAG | Number of cosines for defining source angular distribution | _37 |
| | | NRFLB | Number of reflection boundaries | _5 |
| | | NMAT | Number of regions having different Mie phase functions | _10 |
| 4 | 6I10 | NSOREG | Number of source region | |
| | | MAXR | Maximum number of reflections allowed | |
| | | IBASE | Base for random number generator | |
| | | IBAS1 | Base for random number generator | |
| | | IBAS2 | Base for random number generator | |

TABLE II

Group 2 Input Data

| Card | Format | Input Item | Definition | Limit |
|------|--------|------------|---|-------|
| 1 | I10 | LIBRAY | Input group number | =2 |
| 2 | 6R10.4 | HS | Source height | |
| | | DLONG | Large distance for boundary distance calculation | |
| | | DELTA | Small distance for stepping off boundary | |
| | | SMVAL | Small value for testing cosine angle with zero | |
| | | WCO | Weight cut-off parameter | |
| | | ELIM | Maximum number of errors to be allowed | |
| 3 | R10.4 | DMIN | Minimum distance from collision to receiver point | |

using a different base Generating random numbers in this manner insures the independence between consecutive random numbers and decreases the possibility of producing identical histories when a random number generator recycles

3.2 Constants

Table II contains constants in Input Group 2 that are used by the code. Since the values to be assigned these constants depend on the individual problem, they are included as input rather than being fixed within the code. For economy, the distance, DLONG, should be greater than the maximum possible distance within an inside region. The distance, DELTA, should be a small value, but large enough to change the maximum possible distance within an inside region in the fifth or sixth significant digit when added to that distance. ELIM is an input item that will prevent those errors that occur with a very small probability from terminating the problem When fewer than ELIM errors occur, those errors will be listed with the output, but only those histories containing the errors will be terminated. The results for all other histories will be saved and printed as output.

3.3 Source Angular Distribution

Input Group 3 data which are used to describe the source angular distributions are given in Table III. All angular distributions are considered to symmetrical about the vertical, H, axis The source angular distribution is assumed to be defined with a cumulative distribution expressed in terms of the cosine of the angle measured from the positive H axis. Provisions for sampling from a biased distribution

TABLE III. GROUP 3 Input Data (Source Angular Distribution)

| Card | Format | Input Item | Definition | Limit |
|--------------------------------------|--------|------------|--|-----------|
| 1 | 3I10 | LIBRAY | Input group number | =3 |
| | | NAOP | Option for sampling source angles (See Table I) | |
| | | NAG | Number of cosines for defining source angular distribution | ≤ 37 |
| 2 | 6R10.4 | CANG(J) | Cosine values at which the cumulative source angular probabilities are given (cosines in descending order) | J=1, NAG |
| continues on follow- ing cards | | | | |
| Follows last card containing CANG(J) | 6R10.4 | PAG(J) | Cumulative probabilities defining source angular distribution (first value must be zero, probabilities in ascending order) | J=1, NAG |
| Follows last card containing PAG(J) | 6R10.4 | WAG(J)* | Weight parameter for biased sampling from anisotropic distribution (omit unless NAOP=1) | J=1, NAG |

* WAG(J) is the weight that will be assigned to particles emitted from the source at angles with cosines between CANG(J-1) and CANG(J). Thus WAG(1) is arbitrary, since it will never be used by the code.

are also included to improve the sampling in the directions toward the receiver positions. If the original angular distribution is isotropic, then the program adjusts the light particle weight automatically, but if the original distribution is anisotropic, then the weight adjustment parameters, WAG, must be input.

3.4 Reflection Distribution

Table IV lists Input Group 4 data which are used in describing the reflection of light from a ground or cloud surface. If the problem contains no reflection surfaces, this group of data may be omitted. A listing of Input Group 4 data is required for each reflection surface. The reflection surfaces are limited to 5 for any one problem and the boundary number assigned to any reflection surface must be less than or equal to 5. Reflection is limited to plane surfaces. The angular distribution of the reflected light must be expressed in terms of the cosine of the angle measured from the normal to the reflection surface and is assumed azimuthally symmetric. If the reflection distribution is isotropic in the upper or lower hemispheres, then the reflection angle distribution tables should be omitted. If the reflection distribution is anisotropic, then both the reflection distribution and the cumulative distribution must be input.

TABLE IV. GROUP 4 Input Data (Reflection Distributions)

| Card | Format | Input Item | Definition | Limit |
|------------------------------|--------|---|--|----------------------------------|
| 1 | 5I10 | LIBRAY | Input group number | =4 |
| | | NRB | Number of reflection boundary | ≤ 5 |
| | | JREFLT(NRB) | Reflection Option = 1, reflection isotropic in upper hemisphere = 2, anisotropic in upper hemisphere = 3, isotropic in lower hemisphere = 4, anisotropic in lower hemisphere | |
| | | NRFANG(NRB) | Number of points used to define reflection distribution at boundary NRB | ≤ 37 |
| | | NRFCOS(NRB) | Number of cosines defining cumulative reflection distribution at boundary NRB | ≤ 50 |
| 2 | R10.4 | ALBEDO(NRB) | Reflection Albedo | |
| 3 | 6R10.4 | *RFANG(NRB,J) continues on following cards | Cosines of angles used to define reflection distribution (omit if JREFLT(NRB)=1 or 3, J=1, descending order) | ≤ 37 NRFANG(NRB) |
| Follows last card of RFANG's | 6R10.4 | *POR(NRB,J) | Probability of reflecting per unit solid angle into an angle whose cosine is RFANG(NRB,J) (Omit if JREFLT(NRB) = 1 or 3) | ≤ 37 J=1, NRFANG(NRB) |
| Follows last card of POR's | | RFLCOS(NRB,J) | Cosine values of reflection angle corresponding to the cumulative reflection distribution for values of J/NRFCOS(NRB). Input the values of RFLCOS in descending order. First cosine is input for probability = 1/NRFCOS(NRB). (Omit if JREFLT = 1 or 3). | ≤ 37 J=1, NRFCOS(NRB) |

* These values are not used in LITE-II; however, if JRFLT(NRB) equals 2 or 4, some arbitrary values must be input for these values, since the instructions for reading in these items have not been removed from LITE-II.

3.5 Printout Control

Input Group 5 data, which describes the upper bounds of the print angle groups and the print collision numbers, are shown in Table V. The upper bounds of the print angles are given in terms of the cosine of the angles between the source-receiver axis and the direction of the scattered light at the receiver position for LITE-I and in terms of the cosine of the angle between the particle's direction and the normal to the receiver plane for LITE-II. The print collision numbers are the orders of scattering for which scattered light intensities are to be listed. The light intensity from all orders of scattering greater than the previous collision number up to and including the given collision number is listed opposite each print collision number.

TABLE V. Group 5 Input Data (Printout Control)

| Card | Format | Input Item | Definition | Limit |
|---|--------|------------------------------|---|------------|
| 1 | 3I10 | LIBRAY | Input group number | =5 |
| | | NPCOL | Number of print collisions | ≤24 |
| | | NPA | Number of print cosines | ≤25 |
| 2 continues on follow- ing cards | 6I10 | INCOL(J) | Print collision numbers (in ascending order) | J=1, NPCOL |
| | | Follows last card of INCOL's | 6R10.4 CIPA(J) Print cosines (descending order) | J=1, NPA |

3.6 Detector Locations

Input Group 6 data, which describe the detector locations, are listed in Table VI. In tracing histories with LITE-I, only the height and radius of each collision point are preserved to identify the location of the collisions. The azimuthal angle between a plane containing the source and collision points and a plane containing the source and detector points is selected at random from a uniform distribution between 0 and 2π . To improve the statistics, several azimuthal angles may be selected for a given detector radius and an estimate made of the light intensity, scattered to the detector for each azimuthal angle so determined. The intensities at detector points defined by each of these azimuthal angles are averaged to obtain the intensities at a single detector point. The input item NPHID(J) specifies the number of azimuthal positions that will be selected for the jth detector point. In LITE-II only the heights of the collision points are recorded, thus the values input for RD(I) and NPHID(I) are not used in the scattering calculation and may be left blank.

In LITE-I, DBSS(J) is the light intensity per unit source strength emitted per unit solid angle in a direction toward a point located on the jth detector ring. LITE-I calculates the direct beam intensity for the jth detector ring with the expression,

$$DBI = DBSS(J)e^{-RHOT/T^2}$$

where RHOT is the number of optical path lengths between the source and the jth detector point, and T is the distance from the source point to the jth detector point.

TABLE VI. Group 6 Input Data (Detector Locations)

| Card | Format | Input Item | Definition | Limit |
|------|----------------------|------------|--|-------|
| 1 | 2I10 | LIBRAY | Input p number | -6 |
| | | NDMAX | Number of detector rings | ±10 |
| 2 | 2R10.4, I10,R10.4 | HD(1) | Height of 1st detector ring | |
| | | *RD(1) | Radius of 1st detector ring | |
| | | *NPHID(1) | Number of detector points on 1st ring | |
| | | *DBSS(1) | Direct beam source strength for 1st detector | |
| 3 | 2R10.4, I10,R10.4 | HD(2) | Height of 2nd detector ring | |
| | | *RD(2) | Radius of 2nd detector ring | |
| | | *NPHID(2) | Number of detector points for 2nd ring | |
| | | DRSS(2) | Direct beam source strength for 2nd detector | |

A card similar to 2 and 3 is required for each detector ring

| | | | |
|----------------------|----------------------|---------------|--|
| Last card of group 6 | 2R10.4, I10,R10.4 | HD(NDMAX) | Height of last detector ring |
| | | *RD(NDMAX) | Radius of last detector ring |
| | | *NPHID(NDMAX) | Number of detector points on last ring |
| | | *DBSS(NDMAX) | Direct beam source strength for last detector ring |

* The NPHID(J) values are not used by LITE-II, and the RD(J) and DBSS(J) values should be input for LITE-II as discussed in Section 5.6

The equation used for direct-beam calculations in both LITE-I and LITE-II are identical, therefore, the direct-beam calculation is only applicable to plane parallel sources in LITE-II. For a plane parallel source, the values input for RD(J) should be given by the expression

$$RD(J) = (HD(J)-HS)/\cos\theta_o$$

where HD(J) is the height of the Jth receiver plane,

HS is the height of the source, and

$\cos\theta_o$ is the cosine of the angle at which the source is incident upon the slab.

In addition, DBSS(J) should be input as the product of the number of particles emitted per unit area from the source plane times the secant of the source angle times the slant thickness squared, T^2 , between the source and receiver plane.

3.7 Geometry Description

Input Group 7 data listed in Table VII provides for the geometry description. An air-ground geometry is defined with region boundaries composed of horizontal planes and right circular vertical cylinders in LITE-I and by horizontal planes in LITE-II. The planes are identified as boundary type 1 and the cylinders as boundary type 2. For boundary type 1, COEE is the H intercept of the plane, and for boundary type 2, COEE is the radius of the cylindrical surface. All reflection surfaces must be assigned boundary numbers less than or equal to 5. A negative sign preceding the boundary number, NBOUND, denotes a reflection boundary. Regions are defined by the signed boundary numbers encompassing the region. In reference to

TABLE VII Group 7 Input Data (Geometry Description)

| Card | Format | Input Item | Definition | Limit |
|---|----------------|------------------|--|-------|
| 1 | 3I10 | LIBRAY | Input group number | = 7 |
| | | NBMAX | Number of boundaries | _100 |
| | | NRMAX | Number of regions | _100 |
| 2 | 2I10 | R10.4 *NBOUND(1) | Position of boundary 1 in boundary table | |
| | | ITYPE(1) | Type of boundary 1. ITYPE(1) = 1, H plane ITYPE(1) = 2, cylinder | |
| | | COEE(1) | Coefficient of boundary 1 | |
| <hr/> | | | | |
| A card similar to card 2 is required for each boundary. | | | | |
| <hr/> | | | | |
| Follows last boundary card | 3I5, R5.2, 8I5 | *NREG(1) | Position of region 1 in region table | |
| | | NB(1) | Number of boundaries encompassing region 1 | |
| | | MAT(1) | Phase function number for region 1 | |
| | | EMP(1) | Importance number for region 1 | |
| | | IB(1,1) | First boundary, bounding region 1 (sign on IE designates inner or outer boundary with respect to region 1) | |
| | | MPR(1,1) | Most probable region of entry across first boundary of region 1 | |
| | | IB(1,2) | Second boundary bounding region 1 with appropriate sign | |
| | | MPR(1,2) | Most probable region of entry across second boundary of region 1 | |
| | | IB(1,3) | Third boundary bounding region 1 with appropriate sign | |
| | | MPR(1,3) | Most probable region of entry across third boundary of region 1 | |
| | | IB(1,4) | Fourth boundary bounding region 1 with appropriate sign | |
| | | MPR(1,4) | Most probable region of entry across fourth boundary of region 1 | |
| <hr/> | | | | |
| A card similar to the preceding card is required for each region including outside regions. | | | | |
| <hr/> | | | | |

* Boundaries and regions are assigned numbers sequentially in the order they are listed in the input. The values NBOUND(j) and NREG(j) therefore should both begin with 1 for the first boundary or region listed and increase sequentially for the remaining boundaries or regions

planes, the minus sign denotes a "lower" plane, and the plus sign denotes an "upper" plane. In reference to a cylindrical surface, the minus sign denotes an "inner" surface, and the plus sign denotes an "outer" surface. All space must be identified including outside regions which are not completely encompassed by boundaries. The most probable regions of entry, MPR, are given to speed up the region search process. When there are two or more possible regions of entry across a given boundary, the region with the smallest region number should be given as the most probable region of entry.

The region importance number, EMP, is given to reduce the sampling in regions of minor importance. A particle when crossing from one region to a region of more importance will not be affected by the region importance numbers. However, when a particle crosses from a region to a region of less importance, a random number will be generated and the history terminated if the ratio of the importance numbers (EMP for region entered/EMP for region exited) is less than the random number. If the ratio of the importance numbers is greater than the random number, then the particle weight is multiplied by the reciprocal of the ratio and tracing of the history is continued.

3.8 Mie Scattering Data

The Input Group 8 data listed in Table VIII defines the Mie scattering phase functions to be used in the air-ground geometry. The data shown in Table VIII for Input Group 8 must be repeated for each phase function to be defined. Up to 10 phase functions may be defined in any one problem. MAT is the number assigned to the phase function defined by the data in Input Group 8. This number is used

TABLE VIII. Group 8 Input Data (Mie Scattering Data)

| Card | Format | Input Item | Definition | Limit |
|--------------------------------|-------------------|--------------------|---|-------------------------|
| 1 | 2I10 | LIBRAY | Input group number | =8 |
| | | MAT | Mie scattering phase function number for the following data | -10 |
| 2 | 2I10 10X,R10.4 | NDFCOS (MAT) | Number of cosines for which the Mie scattering phase function are given | -50 |
| | | NPHANG (MAT) | Number of cosines used to describe the cumulative angular distributions for Mie scattering | -50 |
| | | RAYLEE(MAT) | = 1, Rayleigh scattering only = 0, Both Rayleigh and Mie Scattering | |
| 3 | 6R10.4 | *DIFCOS (MAT,J) | Cosine values at which Mie scattering phase functions are listed (descending order) Omit if RAYLEE = 1 | J=1, NDFCOS (MAT) |
| Follows last DIFCOS card | 6R10.4 | *PDCOS (MAT,J) | Values of the phase function at the designated cosines Omit if RAYLEE = 1 NDFCOS values. | J=1, NDFCOS (MAT) |
| Follows last PDCOS card | 6R10.4 | PHANG (MAT,J) | Cosines at equal probability intervals describing cumulative phase function Omit if RAYLEE = 1 (descending order) PHANG(MAT,J) = 1, NPHANG(MAT) | J=1, NPHANG (MAT) |

* The values input for DIFCOS(MAT,J) and PDCOS(MAT,J) are not used by LITE-II. However, at least one value must be input for each of these items if RAYLEE(MAT) is less than 1 (The provisions for reading in these values were not removed from LITE-II.)

to designate the phase function for each of the regions defined by the Input Group 7 data.

Special routines have been incorporated into the code for treating Rayleigh scattering, therefore, it is only necessary to input the Mie scattering phase functions. If only Rayleigh scattering is to be considered (RAYLEE = 1.0), then Input Group 8 data defining DIFCOS(MAT,J), PDCOS(MAT,J), and PHANG(MAT,J) may be omitted. When Mie scattering is treated, both the phase function and the cumulative Mie scattering angular distribution must be input.

3.9 Cross Section Input Data

Input Group 9 data give the number of mean-free-path lengths to ground level, the ratio of the scattering-to-total cross section, and the ratio of Rayleigh to scattering cross section as of function of altitude. The scattering cross section is taken to be the sum of the Mie and Rayleigh scattering cross sections. The difference between the extinction coefficient (total cross section) and the scattering cross section is defined as the absorption cross section.

The number of mean-free-path lengths, TAU, from the ground level to height HV is defined by the equation

$$\text{TAU} = \int_0^{\text{HV}} \Sigma_T(h) dh$$

where $\Sigma_T(h)$ is the extinction coefficient as a function of the altitude h.

TABLE IX. Input Group 9 (Cross Section Input Data)

| Card | Format | Input Item | Definition | Limit |
|------|----------------------------|------------|--|----------|
| 1 | 2I10 | LIBRAY | Input group number | =9 |
| | | NOH | Number of altitudes at which the path lengths from zero to HV are listed | -100 |
| 2* | 4R10.4 through NOH+1 | HV(J)* | Altitude for which cross section data is to be listed | J=1, NOH |
| | | TAU(J) | Number of path lengths from zero to HV(J) | J=1, NOH |
| | | SCATR(J) | Ratio of scattering-to-total cross section for altitude HV(J) | J=1, NOH |
| | | RAYR(J) | Ratio of Rayleigh-to-scattering cross section for altitude HV(J) | J=1, NOH |

* Card 2 contains the four items HV(J), TAU(J), SCATR(J), and RAYR(J) for J=1, the same four items for J=2 are on the next cards, and etc.

3.10 Data Print and Check Options

Data for Input Group 10 as given in Table X are contained on a single card. This card gives the problem number and data print and check options. The problem number is printed on output to identify the output data. IDUMP is a print option that allows the printout of intermediate values calculated during the generation of each history. This option is included to aid in checkout. The quantity of printout produced when IDUMP is non-zero makes it inadvisable to print the intermediate data if more than ten histories are being processed.

ICHECK is an option that provides for several checks on the input data. The input cumulative probability tables are checked for ascending order, and several of the cosine tables are checked for descending order. In addition, various input values are checked to insure that storage locations reserved for dimensioned variables are not exceeded. Cards within the input data groups 1 through 9 must be arranged in the order specified in Tables I through IX, but it is not necessary to order the groups. The cards for Input Group 10 must be loaded after the cards for all other input groups have been loaded.

3.11 Loading Instructions

The LITE codes are designed to process several problems during any one computer run. The input data for a second problem may be loaded directly behind the input data for Input Group 10 for the previous problem. Furthermore, if any of the input data groups 1 through 9 are identical for two consecutive problems, that input data group may be omitted in the second problem. Each individual problem must contain a card for input Group 10.

TABLE X. Group 10 Input Data (Data Print and Check Options).

| Card | Format | Input Item | Definition | Limit |
|------|--------|------------|---|-------|
| 1 | 4110 | LIBRAY | Input group number | =10 |
| | | NPROB | Problem number | |
| | | IDUMP | Option for intermediate printout = 0, no intermediate printout = 1, gives intermediate printout | |
| | | ICHECK | Option for checking input data = 0, no check on input data = 1, check input data | |

IV. SAMPLE PROBLEMS

The sample problems given in this section for both LITE-I and LITE-II were designed to calculate the angular distribution of the scattered radiation emerging from a Rayleigh atmosphere.

4.1 LITE-I Sample Problem

In order to compute the transmitted intensity through a 0.5 mean-free-path thick Rayleigh atmosphere with a ground albedo of 0.8, the point receivers in the LITE-I problem were placed just slightly above the ground surface at distances 0 50, 150, 300 and 500 units from the vertical axis through the source point. The units selected are arbitrary units, since the atmospheric thickness is measured in terms of optical thicknesses (mean-free-path). The Rayleigh atmosphere was described as being 301 units thick with a cross section varying exponentially according to the expression,

$$\Sigma(h) = 0.00625e^{-0.0125h}$$

where h is the altitude in the arbitrary units. Thus the point receivers were located at 0, 0.3125, 0.9375, 1.875 and 3.125 mean-free-paths from the vertical axis through the source point.

Table XI lists the input data for the LITE-I sample problem. One thousand (1000) histories were processed in ten groups of 100 histories each. A maximum of 20 collisions and 10 reflections were allowed for each history. The source angular distribution was confined to a single angle normal to the upper surface of the atmosphere. The angular distribution of the reflected photon current was input as a cosine distribution to conform to Lambert's law of reflection. The atmosphere was described with three regions separated by two parallel

planes 301 units apart. The upper and lower regions were given an importance number of zero, so that particles entering those regions would be terminated. The source was located at a height of 300 units above the ground

The output for the LITE-I problem is listed in Table XII. The first ten pages of Table XII list the scattered intensity as a function of collision number for each of the receiver points and each of the ten history groups. The eleventh page of Table XII contains averages of the scattered intensities over the ten history groups. The twelfth page of Table XII gives the deviations of the group intensities about the average intensities over all the groups.

On the thirteenth page of Table XII, the history termination counters give the number of histories terminated after exceeding the maximum number of collisions allowed, by escaping the atmosphere, and by the particle weight dropping below the input weight cutoff value. The thousand histories produced 11,901 collisions which is an average of 11.901 collisions per history. In pages 14 through 23 of Table XII, the angular distribution of the scattered intensities are given as a function of the order of reflection for each receiver point. The cosine values listed on these pages are the cosines of the angle measured from the source-receiver axis for each of the receiver positions. Page 24 of Table XII shows the scattered intensities as a function of the region of scatter. Page 25 of Table XII gives the reflected intensity at each of the receivers, and the last page of Table XII gives the direct intensity at each of the receivers. The units of the intensities computed for the LITE-I sample problem are (Text continues on page 52.)

photons/unit area per source photon where the unit area is in the arbitrary units used to define the thickness of the atmosphere. If one assumes that the thickness of the atmosphere is 30 KM, then multiplication of the intensities given in Table XII by 10^{-8} would result in intensities that have units of photons cm^{-2} per source photon.

In order to compare the results of this sample problem with transmission data for a normal incident broad beam source, the reflected intensity at each receiver should be subtracted from the total scattered intensity, since the total scattered intensity includes the intensity reflected from the ground surface. The differences should then be plotted as a function of the radial position of the receivers and this radial distribution integrated over the plane containing the detector points to give the transmitted intensity for radiation incident normal to the atmosphere.

4.2 LITE-II Sample Problem

The LITE-II sample problem was designed to calculate the angular distributions of the scattered intensities at several depths in a Rayleigh atmosphere of 0.5 mean-free-path in thickness and with a ground albedo of 0.8, due to a plane source incident at $\theta_0 = \cos^{-1} 0.6$. Table XIII shows the input data for the LITE-II problem. A total of 2000 histories were divided into ten groups of 200 histories each. A maximum of 20 collisions were allowed for each history. The atmosphere and ground reflection distribution is defined in the same manner as in the sample problem for LITE-I.

Four receiver planes were placed within the atmosphere at altitudes of 0.1, 100, 200 and 299 units above ground level. The lower receiver plane is sufficiently close to the lower surface of the atmosphere to record the scattered intensity transmitted through the atmosphere. The upper plane is sufficiently close to the upper surface to record radiation emerging from the top of the atmosphere. The output for the LITE-II sample problem shown in Table XIV is in the same format as that previously shown for the LITE-I sample problem.

To obtain the transmitted intensity from the data printed for the first receiver, only those intensities listed for those cosine intervals with lower bounds ranging from -0.1 to -1.0 should be considered. The intensities given for those cosine intervals with lower bounds ranging from 0.9 to 0.0 are mainly comprised of the intensity reflected from the ground surface and would not be transmitted through the lower surface of the atmosphere. The intensities given in Table XIII for the last receiver position that fall in cosine intervals with lower bounds between 0.9 to 0.0 are the intensities emerging from the top surface of the atmosphere. The units of the LITE-II computed intensities are photons/unit area per source photon/unit area, where the unit area is parallel to the top of the atmosphere.

V. PROGRAM DESCRIPTION

Each of the LITE codes are divided into several subroutines which are designated as procedures in the ALGOL language. The ALGOL programs are compiled each time they are loaded on the computer and no object decks are produced. The ALGOL language requires that any procedure called by another procedure must be loaded before the calling procedure. For this reason the procedures used in the LITE-I and LITE-II codes are listed in the following sections in reverse order with respect to the order they are actually used on the machine. The following is a listing of the procedures used in the LITE codes and a one sentence description of each procedure.

Procedures Used in the LITE-I and LITE-II Codes

| Procedure | Purpose |
|---------------------|---|
| MAIN | Reads in the input data |
| SRMAIN ⁺ | Controls the flow of the problem on the machine |
| SRCHECK | Checks input data |
| SRDBEAM | Calculates direct intensities |
| SRSCITANG | Calculates scattering and direction after collision |
| SRREFLCT | Calculates new direction after a reflection |
| SRINITIAL | Initializes parameters used in accumulating the scattered intensities |
| SRPATHL | Generates random path lengths between collisions |
| SRANGLE | Selects source angles from input distribution |
| SRAVRAGE | Calculates and prints average scattered intensities as a function of collision number and receiver position over each deviation group |

| Procedure | Purpose |
|-----------------------|--|
| SRANSWER | Calculates and prints the average scattered intensities as a function of receiver position, receiver angle, and order of reflection over all histories |
| SRDETECT ⁺ | Calculates scattered intensities at receiver points from each collision point |
| SRDIFSCA [*] | Calculates the probability of a photon scattering into a direction so as to be headed toward the receiver from each collision point and reflection surface |
| SRDSTBD | Calculates the distance along particles direction to boundary of region containing collision |
| SRSEARCH | Locates region containing the particles position coordinates for each collision |
| SRRANDA | Generates random numbers used in the sampling processes |

* This procedure is used only in LITE-I

+ These procedures are different for each code. All other procedures are the same in both codes

The ALGOL listing of LITE-I is given in Section 5.1 and the ALGOL listing of LITE-II is given in Section 5.2. Card numbers 1000 - 18000 of the ALGOL language version of both codes contain control cards for operation of the codes on the Burroughs B-5000 computer. Cards 19000 - 116000 of both codes contain lists of the subscripted real and integral variables that are common to all of the procedures included in the LITE codes. Cards 117000 through 129000 contain function subprograms furnished by the B-5000 monitor system

5.1 ALGOL LISTING FOR THE LITE-I CODE

13. ABSTRACT

Monte Carlo procedures designated as the LITE-I and LITE-II codes were developed to study the transport of light through the earth's atmosphere under various environmental conditions. The LITE-I code treats monochromatic light emitted from a point source, and the LITE-II code treats monochromatic plane sources of light. The codes have been written in both ALGOL for the Burroughs B-5000 and FORTRAN-II for other computers. The codes are sufficiently flexible to treat multiple scattering in an atmosphere in which air density and aerosol size distribution vary independently and arbitrarily with altitude. Provision for treating ground and cloud reflection with an albedo method is also available in the codes.

The codes have been verified through comparisons with other calculations of light transport in the atmosphere. Utilization instructions, input data formats, sample problems, and the ALGOL listings of the codes are given to aid those who wish to utilize the codes.

INSTRUCTIONS

I. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantees, Department of Defense activity or other organization (corporate author) issuing the report.

2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. REPORT DATE: Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.

7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.

8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those

imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.

12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
